Computational modeling in economics

Motivation

- Facilitate academic rigor
- Study mechanisms
- Predict public policies

Computational modeling in economics

Motivation

- Facilitate academic rigor
- Study mechanisms
- Predict public policies

Transdisciplinary in nature

- Economic model
- Mathematical framework
- Computational implementation

Eckstein–Keane–Wolpin models

Understanding individual decisions

- Human capital investment
- Consumption–savings decision

Eckstein–Keane–Wolpin models

Understanding individual decisions

- Human capital investment
- Consumption–savings decision

Predicting effects of policies

- Welfare programs
- Tax schedules

Eckstein–Keane–Wolpin models

Understanding individual decisions

- Human capital investment
- Consumption–savings decision

Predicting effects of policies

- Welfare programs
- Tax schedules

Mathematical framework and implementation

- Finite-horizon discrete Markov decision problem
- Backward induction algorithm

Eckstein–Keane–Wolpin models

Understanding individual decisions

- Human capital investment
- Consumption–savings decision

Predicting effects of policies

- Welfare programs
- Tax schedules

Mathematical framework and implementation

- Finite-horizon discrete Markov decision problem
- Backward induction algorithm

⇒ Transdisciplinary research on their **economics**, data, and computation

Economic model

Decision problem

$t = 1, \dots, T$ decision period

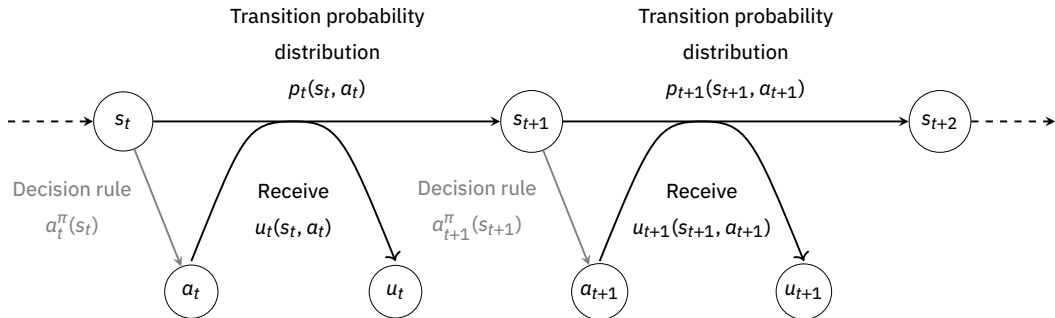

$s_t \in S$ state

$a_t \in A$ action

$a_t(s_t)$ decision rule

$u_t(s_t, a_t)$ immediate utility

Timing of events

$\pi = (a_1^\pi(s_1), \dots, a_T^\pi(s_T))$ policy

δ discount factor

$p_t(s_t, a_t)$ conditional distribution

$$\max_{\pi \in \Pi} E_{s_1}^{\pi} \left[\sum_{t=1}^T \delta^{t-1} u_t(s_t, a_t^{\pi}(s_t)) \right]$$

Core economics

- Rational expectations
- Exponential discounting
- Time-separability

Mathematical formulation

Dynamic programming

Policy evaluation

$$v_t^\pi(s_t) = \mathbb{E}_{s_t}^\pi \left[\sum_{j=0}^{T-t} \delta^j u_{t+j}(s_{t+j}, a_{t+j}^\pi(s_{t+j})) \right]$$

Optimality equations

$$v_t^{\pi^*}(s_t) = \max_{a_t \in A} \left\{ u_t(s_t, a_t) + \delta \mathbb{E}_{s_t}^{\pi^*} \left[v_{t+1}^{\pi^*}(s_{t+1}) \right] \right\}$$

Backward induction algorithm

for $t = T, \dots, 1$ **do**

if $t = T$ **then**

$$v_T^{\pi^*}(s_T) = \max_{a_T \in A} \left\{ u_T(s_T, a_T) \right\} \quad \forall s_T \in S$$

else

 Compute $v_t^{\pi^*}(s_t)$ for each $s_t \in S$ by

$$v_t^{\pi^*}(s_t) = \max_{a_t \in A} \left\{ u_t(s_t, a_t) + \delta E_{s_t}^{\pi} \left[v_{t+1}^{\pi^*}(s_{t+1}) \right] \right\}$$

 and set

$$a_t^{\pi^*}(s_t) = \arg \max_{a_t \in A} \left\{ u_t(s_t, a_t) + \delta E_{s_t}^{\pi} \left[v_{t+1}^{\pi^*}(s_{t+1}) \right] \right\}$$

end if

end for

Calibration procedure

Data

Dataset

$$\mathcal{D} = \{a_{it}, \bar{s}_{it}, \bar{u}_{it} : i = 1, \dots, N; t = 1, \dots, T_i\}$$

State variables

- $s_t = (\bar{s}_t, \varepsilon_t)$
 - \bar{s}_t observed
 - ε_t unobserved

Procedures

Likelihood-based

$$\hat{\vartheta} = \arg \max_{\vartheta \in \Theta} \prod_{i=1}^N \prod_{t=1}^{T_i} p_{it}(a_{it}, \bar{u}_{it} \mid \bar{s}_{it}, \vartheta)$$

Simulation-based

$$\hat{\vartheta} = \arg \min_{\vartheta \in \Theta} (M_D - M_S(\vartheta))' W (M_D - M_S(\vartheta))$$

Example

Michael P. Keane and Kenneth I. Wolpin. 1997. “The career decisions of young men.” *Journal of Political Economy* 105 (3): 473–522 .

- The study follows individuals over their working life from young adulthood at age 16 to retirement at age 65 where the decision period $t = 16, \dots, 65$ is a school year.
- Individuals decide $a \in \mathcal{A}$ whether to work in a blue-collar or white-collar occupation ($a = 1, 2$), to serve in the military ($a = 3$), to attend school ($a = 4$), or to stay at home ($a = 5$).

Decision tree

$$u_t(s_t) = \begin{cases} \zeta_a(s_t) + w_a(s_t) & \text{if } a \in \{1, 2, 3\} \\ \zeta_a(s_t) & \text{if } a \in \{4, 5\} \end{cases}$$

Informed by reduced-form evidence

- Mincer equation
- Sheepskin effects
- Skill depreciation
- Mobility and search costs
- Monetary and psychic cost of schooling

- Work experience k_t and years of completed schooling h_t evolve deterministically.

$$k_{a,t+1} = k_{a,t} + 1[a_t = a] \quad \text{if } a \in \{1, 2, 3\}$$

$$h_{t+1} = h_t + 1[a_t = 4]$$

- Productivity shocks ε_t are uncorrelated across time and follow a multivariate normal distribution with mean $\mathbf{0}$ and covariance matrix Σ .
- Given the structure of the utility functions and the distribution of the shocks, the state at time t is $s_t = \{k_t, h_t, t, a_{t-1}, \mathbf{e}, \varepsilon_t\}$.

Utility of blue-collar occupation

- Non-pecuniary

$$\begin{aligned}\zeta_1(\cdot) = & \alpha_1 + c_{1,1} \cdot \mathbf{1}[a_{t-1} \neq 1] + c_{1,2} \cdot \mathbf{1}[k_{1,t} = 0] \\ & + \vartheta_1 \cdot \mathbf{1}[h_t \geq 12] + \vartheta_2 \cdot \mathbf{1}[h_t \geq 16] + \vartheta_3 \cdot \mathbf{1}[k_{3,t} = 1]\end{aligned}$$

- Wage component

$$w_1(\cdot) = r_1 x_1(\cdot),$$

where $x_1(\cdot)$ is the occupation-specific skill level.

$$x_1(\cdot) = \exp \left(\Gamma_1(\mathbf{k}_t, h_t, t, a_{t-1}, e_{j,1}) \cdot \varepsilon_{1,t} \right)$$

- Parameterization of the deterministic component of the skill production function:

$$\begin{aligned} \Gamma_1(\cdot) = & e_{j,1} + \beta_{1,1} \cdot h_t + \beta_{1,2} \cdot \mathbf{1}[h_t \geq 12] + \beta_{1,3} \cdot \mathbf{1}[h_t \geq 16] \\ & + \gamma_{1,1} \cdot k_{1,t} + \gamma_{1,2} \cdot (k_{1,t})^2 + \gamma_{1,3} \cdot \mathbf{1}[k_{1,t} > 0] \\ & + \gamma_{1,4} \cdot t + \gamma_{1,5} \cdot \mathbf{1}[t < 18] \\ & + \gamma_{1,6} \cdot \mathbf{1}[a_{t-1} = 1] + \gamma_{1,7} \cdot k_{2,t} + \gamma_{1,8} \cdot k_{3,t} \end{aligned}$$

National Longitudinal Survey of Youth 1979

- 1,373 individuals starting at age 16
- Life cycle histories
 - School attendance
 - Occupation-specific work status
 - Wages

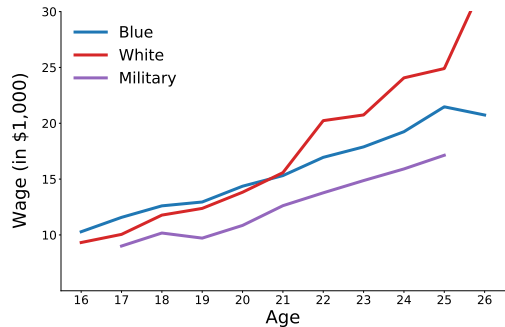

Sample size

Data descriptives

(a) Choices

(b) Wages

Calibration results

(a) Average wage

(b) Blue-collar

(a) Time preference

(b) Tuition subsidy

Projects

Research projects

Economics and data

- **Biased expectations** Incorporate subjective expectations
Collaboration with DIW for SOEP-IS data collection
- Robust decisions
- Option value

Economics and data

- Biased expectations
- **Robust decisions** Account for ubiquitous uncertainties
Robust decision in light of model misspecification
- Option value

Research projects

Economics and data

- Biased expectations
- Robust decisions

- **Option value**

Schooling reform for identification and validation
Collaboration with Statistics Norway

Research projects

Computation

- **Uncertainty quantification** Capture parametric uncertainty
Assess competing policy implications
- Global optimization
- HPC implementation

Research projects

Computation

- Uncertainty quantification
- **Global optimization** Explore estimation uncertainty
Acknowledge multiplicity of local minima
- HPC implementation

Research projects

Computation

- Uncertainty quantification
- Global optimization

- **HPC implementation**

Enable increased realism and auditing of economic models
Exploit large-scale parallelism on supercomputers
