# **Eckstein-Keane-Wolpin** models

An invitation for transdisciplinary collaboration

#### **Computational modeling in economics**

- provide learning opportunities
- assess importance of competing mechanisms
- predict the effects of public policies

#### **Eckstein-Keane-Wolpin (EKW) models**

- understanding individual decisions
  - human capital investment
  - savings and retirement
- predicting effects of policies
  - welfare programs
  - tax schedules

#### **Transdisciplinary components**

- economic model
- mathematical formulation
- computational implementation

#### **Cooperations**

Institute for Numerical Simulation

#### Roadmap

- Setup
- Example
- Improvements
- Extensions

# Setup

#### **Components**

- economic model
- mathematical formulation
- calibration procedure

## Economic model

#### **Decision problem**

 $t = 1, \dots, T$  decision period

 $s_t \in S$  state

 $a_t \in A$  action

 $a_t(s_t)$  decision rule

 $r_t(s_t, a_t)$  immediate reward

#### **Timing of events**

$$\pi=(a_1^\pi(s_1),\ldots,a_T^\pi(s_T))$$
 policy  $\delta$  discount factor  $p_t(s_t,a_t)$  conditional distribution

#### Individual's objective

$$\max_{\pi \in \Pi} \mathsf{E}_{s_1}^{\pi} \left[ \sum_{t=1}^{T} \delta^{t-1} r_t(s_t, a_t^{\pi}(s_t)) \middle| \mathcal{I}_1 \right]$$

## Mathematical formulation

#### **Policy evaluation**

$$v_t^{\pi}(s_t) \equiv \mathsf{E}_{s_t}^{\pi} \left[ \left. \sum_{j=0}^{T-t} \delta^j r_{t+j}(s_{t+j}, a_{t+j}^{\pi}(s_{t+j})) \right| \, \mathcal{I}_t \, \right]$$

Inductive scheme

$$\boldsymbol{v}_t^{\pi}(\boldsymbol{s}_t) = r_t(\boldsymbol{s}_t, \boldsymbol{a}_t^{\pi}(\boldsymbol{s}_t)) + \delta \, \mathsf{E}_{\boldsymbol{s}_t}^{\pi} \left[ \left. \boldsymbol{v}_{t+1}^{\pi}(\boldsymbol{s}_{t+1}) \right| \, \mathcal{I}_t \, \right]$$

#### **Optimality equations**

$$egin{aligned} oldsymbol{v}_t^{\pi^*}(oldsymbol{s}_t) &= \max_{oldsymbol{a}_t \in A} \left\{ r_t(oldsymbol{s}_t, oldsymbol{a}_t) + \delta \, \mathsf{E}_{oldsymbol{s}_t}^{\pi^*} \left[ \left. oldsymbol{v}_{t+1}^{\pi^*}(oldsymbol{s}_{t+1}) \, \middle| \, \mathcal{I}_t \, 
ight] 
ight\} \end{aligned}$$

#### **Backward induction algorithm**

$$\begin{aligned} &\textbf{for } t = T, \dots, 1 \textbf{ do} \\ &\textbf{ if } t == T \textbf{ then} \\ &v_T^{\pi^*}(s_T) = \max_{a_T \in A} \left\{ r_T(s_T, a_T) \right\} \quad \forall s_T \in S \\ &\textbf{ else} \\ &\textbf{ Compute } v_t^{\pi^*}(s_t) \textbf{ for each } s_t \in S \textbf{ by} \\ &v_t^{\pi^*}(s_t) = \max_{a_t \in A} \left\{ r_t(s_t, a_t) + \delta \operatorname{E}_{s_t}^{\pi} \left[ \left. v_{t+1}^{\pi^*}(s_{t+1}) \right| \mathcal{I}_t \right. \right] \right\} \\ &\text{ and set} \\ &a_t^{\pi^*}(s_t) = \underset{a_t \in A}{\operatorname{arg max}} \left\{ r_t(s_t, a_t) + \delta \operatorname{E}_{s_t}^{\pi} \left[ \left. v_{t+1}^{\pi^*}(s_{t+1}) \right| \mathcal{I}_t \right. \right] \right\} \\ &\textbf{ end if} \\ &\textbf{ end for} \end{aligned}$$

## Calibration procedure

#### **Data**

$$D = \{a_{it}, x_{it}, r_{it} : i = 1, ..., N; t = 1, ..., T_i\}$$

#### **State variables**

- $ightharpoonup s_t = (x_t, \epsilon_t)$ 
  - $\triangleright$   $x_t$  observed
  - $\triangleright$   $\epsilon_t$  unobserved

#### **Procedures**

likelihood-based

$$\hat{\theta} \equiv \underset{\theta \in \Theta}{\operatorname{arg \, max}} \prod_{i=1}^{N} \prod_{t=1}^{T_i} p_{it}(a_{it}, r_{it} \mid x_{it}, \theta)$$

simulation-based

$$\hat{\theta} \equiv \underset{\theta \in \Theta}{\arg \min} (M_D - M_S(\theta))' W(M_D - M_S(\theta))$$

# **Example**

#### Model of occupational choice

- ▶ 1,000 individuals starting at age 16
- life cycle histories
  - school attendance
  - occupation-specific work status
  - wages

#### **Labor market**

$$r_t(s_t, 1) = w_{1t} = \exp\{\underbrace{\alpha_{10}}_{\text{endowment}} + \underbrace{\alpha_{11}g_t}_{\text{schooling}} + \underbrace{\alpha_{12}e_{1t} + \alpha_{13}e_{1t}^2}_{\text{own experience}} + \underbrace{\alpha_{14}e_{2t} + \alpha_{15}e_{2t}^2}_{\text{other experience}} + \underbrace{\epsilon_{1t}}_{\text{shock}} \}$$

#### **Schooling**

$$r_t(s_t, 3) = \underbrace{\beta_0}_{\text{taste}} - \underbrace{\beta_1 \mathbb{I}[g_t \ge 12]}_{\text{direct cost}} - \underbrace{\beta_2 \mathbb{I}[a_{t-1} \ne 3]}_{\text{reenrollment effort}} + \underbrace{\epsilon_{3t}}_{\text{shock}}$$

#### **Home**

$$r_t(s_t, 4) = \underbrace{\gamma_0}_{\text{taste}} + \underbrace{\epsilon_{4t}}_{\text{shock}}$$

#### **State space**

$$s_t = \{g_t, e_{1t}, e_{2t}, a_{t-1}, \epsilon_{1t}, \epsilon_{2t}, \epsilon_{3t}, \epsilon_{4t}\}$$

#### **Transitions**

observed state variables

$$e_{1,t+1} = e_{1t} + \mathbb{I}[a_t = 1]$$
 $e_{2,t+1} = e_{2t} + \mathbb{I}[a_t = 2]$ 
 $g_{t+1} = g_t + \mathbb{I}[a_t = 3]$ 

unobserved state variables

$$\{\epsilon_{1t}, \epsilon_{2t}, \epsilon_{3t}, \epsilon_{4t}\} \sim N(0, \Sigma)$$

# Roadmap

#### **Improvements**

- numerical integration
- global optimization
- function approximation
- high-performance computing

#### **Extensions**

- robust decision-making
- uncertainty quantification
- model validation
- nonstandard expectations
