Eckstein-Keane-Wolpin models

An invitation for transdisciplinary collaboration

The OSE team

February 19, 2021

Motivation

- Facilitate academic rigor
- Study mechanisms
- Predict public policies

Motivation

- Facilitate academic rigor
- Study mechanisms
- Predict public policies

Transdisciplinary in nature

- Economic model
- Mathematical framework
- Computational implementation

- Human capital investment
- Consumption–savings decision

- Human capital investment
- Consumption–savings decision

- Welfare programs
- Tax schedules

- Human capital investment
- Consumption–savings decision

Mathematical framework and implementation

- Finite-horizon discrete Markov decision problem
- Backward induction algorithm

- Welfare programs
- Tax schedules

- Human capital investment
- Consumption–savings decision

Mathematical framework and implementation

- Finite-horizon discrete Markov decision problem
- Backward induction algorithm
- \Rightarrow Transdisciplinary research on their **economics**, data, and computation

- Welfare programs
- Tax schedules

- Human capital investment
- Consumption–savings decision

Mathematical framework and implementation

Economic model

| $t = 1, \ldots, T$ | decision period |
|--------------------|-------------------|
| $s_t \in S$ | state |
| $a_t \in A$ | action |
| $a_t(s_t)$ | decision rule |
| $u_t(s_t, a_t)$ | immediate utility |

$$\max_{\pi \in \Pi} \mathsf{E}_{s_1}^{\pi} \left[\left. \sum_{t=1}^{T} \delta^{t-1} u_t(s_t, a_t^{\pi}(s_t)) \right| \frac{I_1}{I_1} \right]$$

Core economics

- Rational expectations
- Exponential discounting
- Time-separability

Mathematical formulation

Policy evaluation

$$\mathbf{v}_t^{\pi}(\mathbf{s}_t) = \mathsf{E}_{\mathbf{s}_t}^{\pi} \left[\sum_{j=0}^{T-t} \delta^j \, u_{t+j}(\mathbf{s}_{t+j}, \mathbf{a}_{t+j}^{\pi}(\mathbf{s}_{t+j})) \, \middle| \, \mathcal{I}_t \right]$$

Optimality equations

$$v_t^{\pi^*}(s_t) = \max_{a_t \in A} \left\{ u_t(s_t, a_t) + \delta \, \mathsf{E}_{s_t}^{\pi^*} \Big[v_{t+1}^{\pi^*}(s_{t+1}) \mid \mathcal{I}_t \, \Big] \right\}$$

```
for t = T_{1}, ..., 1 do
       if t = T then
             v_T^{\pi^*}(s_T) = \max_{a_T \in A} \Big\{ u_T(s_T, a_T) \Big\} \qquad \forall \, s_T \in S
       else
              Compute v_t^{\pi^*}(s_t) for each s_t \in S by
                        v_t^{\pi^*}(s_t) = \max_{a_t \in A} \left\{ u_t(s_t, a_t) + \delta \, \mathsf{E}_{s_t}^{\pi} \big[ v_{t+1}^{\pi^*}(s_{t+1}) \mid \mathcal{I}_t \, \big] \right\}
              and set
                        a_t^{\pi^*}(s_t) = \arg \max_{a_t} \left\{ u_t(s_t, a_t) + \delta \, \mathsf{E}_{s_t}^{\pi} \left[ v_{t+1}^{\pi^*}(s_{t+1}) \mid \mathcal{I}_t \right] \right\}
       end if
```

end for

Calibration procedure

Dataset

$$\mathcal{D} = \{a_{it}, \bar{s}_{it}, \bar{u}_{it} : i = 1, ..., N; t = 1, ..., T_i\}$$

State variables

- $s_t = (\bar{s}_t, \varepsilon_t)$
 - \bar{s}_t observed
 - ε_t unobserved

Likelihood-based

$$\hat{\vartheta} = \arg \max_{\vartheta \in \varTheta} \prod_{i=1}^{N} \prod_{t=1}^{T_i} p_{it}(a_{it}, \bar{u}_{it} \mid \bar{s}_{it}, \vartheta)$$

Simulation-based

$$\hat{\vartheta} = \arg\min_{\vartheta\in\Theta} \left(M_D - M_S(\vartheta) \right)' W \left(M_D - M_S(\vartheta) \right)$$

Example

Michael P Keane and Kenneth I Wolpin. 1997. "The career decisions of young men." *Journal of Political Economy* 105 (3): 473–522.

- The study follows individuals over their working life from young adulthood at age 16 to retirement at age 65 where the decision period t = 16, ..., 65 is a school year.
- Individuals decide $a \in \mathcal{A}$ whether to work in a blue-collar or white-collar occupation (a = 1, 2), to serve in the military (a = 3), to attend school (a = 4), or to stay at home (a = 5).

Decision tree

Informed by reduced-form evidence

• Mincer equation

$$u_t(\mathbf{s}_t) = \begin{cases} \zeta_a(\mathbf{s}_t) + w_a(\mathbf{s}_t) & \text{if } a \in \{1, 2, 3\} \\ \zeta_a(\mathbf{s}_t) & \text{if } a \in \{4, 5\} \end{cases}$$

- Sheepskin effects
- Skill depreciation
- Mobility and search costs
- Monetary and psychic cost of schooling

Transitions

• Work experience *k*_t and years of completed schooling *h*_t evolve deterministically.

$$k_{a,t+1} = k_{a,t} + 1[a_t = a]$$
 if $a \in \{1, 2, 3\}$
 $h_{t+1} = h_t + 1[a_t = 4]$

- Productivity shocks ε_t are uncorrelated across time and follow a multivariate normal distribution with mean **0** and covariance matrix Σ .
- Given the structure of the utility functions and the distribution of the shocks, the state at time t is s_t = {k_t, h_t, t, a_{t-1}, e, ε_t}.

Non-pecuniary

$$\begin{aligned} \zeta_1(\cdot) &= \alpha_1 + c_{1,1} \cdot \mathbf{1}[a_{t-1} \neq \mathbf{1}] + c_{1,2} \cdot \mathbf{1}[k_{1,t} = \mathbf{0}] \\ &+ \vartheta_1 \cdot \mathbf{1}[h_t \geq \mathbf{12}] + \vartheta_2 \cdot \mathbf{1}[h_t \geq \mathbf{16}] + \vartheta_3 \cdot \mathbf{1}[k_{3,t} = \mathbf{1}] \end{aligned}$$

Wage component

 $w_1(\cdot)=r_1\,x_1(\cdot),$

where $x_1(\cdot)$ is the occupation-specific skill level.

$$x_1(\cdot) = \exp\left(\Gamma_1(\boldsymbol{k}_t, h_t, t, a_{t-1}, e_{j,1}) \cdot \varepsilon_{1,t}\right)$$

• Parameterization of the deterministic component of the skill production function:

$$\begin{split} \Gamma_{1}(\cdot) &= e_{j,1} + \beta_{1,1} \cdot h_{t} + \beta_{1,2} \cdot \mathbf{1}[h_{t} \geq \mathbf{12}] + \beta_{1,3} \cdot \mathbf{1}[h_{t} \geq \mathbf{16}] \\ &+ \gamma_{1,1} \cdot k_{1,t} + \gamma_{1,2} \cdot (k_{1,t})^{2} + \gamma_{1,3} \cdot \mathbf{1}[k_{1,t} > \mathbf{0}] \\ &+ \gamma_{1,4} \cdot t + \gamma_{1,5} \cdot \mathbf{1}[t < \mathbf{18}] \\ &+ \gamma_{1,6} \cdot \mathbf{1}[a_{t-1} = \mathbf{1}] + \gamma_{1,7} \cdot k_{2,t} + \gamma_{1,8} \cdot k_{3,t} \end{split}$$

National Longitudinal Survey of Youth 1979

- 1,373 individuals starting at age 16
- Life cycle histories
 - School attendance
 - Occupation-specific work status
 - Wages
